PHASE 3 – PROJECT DESIGN PHASE

Project Title: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Introduction

Project Design is the phase where the overall structure, workflow, and architecture of the proposed system are planned before implementation. It provides a clear blueprint for developing the automated IT procurement system in ServiceNow. This phase explains how different modules interact with each other and how the procurement workflow is automated using Flow Designer.

The design ensures that laptop requests move smoothly from employees to managers and finally to the IT procurement team through an automated workflow.

2. System Design Overview

The project is designed using ServiceNow Flow Designer to automate the complete laptop procurement process. Employees submit requests through the Service Catalog, managers approve the requests, and the IT team receives catalog tasks automatically for procurement and delivery.

The system maintains transparency by updating request status at every stage and sending notifications to the concerned users.

3. System Architecture

The architecture of the project consists of four major components:

- Employee submits a standard laptop request through the Service Catalog.
- Manager reviews and approves or rejects the request.
- Flow Designer automatically triggers the procurement workflow after approval.
- IT Procurement Team receives a catalog task and processes the laptop order.

This architecture provides an organized and automated procurement workflow.

4. Workflow Design

The workflow followed in this project is:

Employee Login → Service Catalog → Laptop Request Form → Manager Approval → Flow Designer Execution → Catalog Task Creation → IT Procurement Team → Laptop Delivery → Request Closed.

Each stage is completed automatically after the previous stage is approved.

5. Project Modules

Employee Request Module
Employees select the Standard Laptop option from the Service Catalog and submit the request by entering the required details.

Manager Approval Module
The submitted request is automatically forwarded to the manager for approval. The manager can approve or reject the request.

Flow Designer Module
After approval, Flow Designer executes the predefined workflow and creates the required procurement task automatically.

Catalog Task Module
A catalog task is generated and assigned to the IT Procurement Team for laptop allocation and delivery.

Notification Module
The system sends automatic notifications to employees, managers, and the IT team during different stages of the workflow.

6. Input Design

The system accepts the following input details from the employee:

- Employee Name.
- Employee ID.
- Department.
- Laptop Requirement.
- Business Justification.
- Delivery Location.

These details are stored in the ServiceNow request record.

7. Output Design

The system produces the following outputs:

- Request Number.
- Approval Status.
- Catalog Task Number.
- Procurement Status.
- Laptop Delivery Status.
- Completion Notification.

The employee can track the request status until completion.

8. Database and Record Design

ServiceNow stores all request details in its database. Each request is assigned a unique request number. Approval records, catalog tasks, and workflow status are maintained automatically, ensuring proper tracking and reporting.

9. Advantages of the Project Design

- Automated workflow execution.
- Faster approval process.
- Real-time request tracking.
- Automatic catalog task creation.
- Reduced manual errors and paperwork.

10. Conclusion

Project Design provides a clear structure for implementing the automated IT procurement system. The ServiceNow Flow Designer workflow connects employees, managers, and the IT procurement team through an efficient and transparent process. This design helps organizations manage standard laptop orders quickly, accurately, and effectively.
