PHASE 2 – REQUIREMENT ANALYSIS

Project Title: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. INTRODUCTION

Requirement Analysis is one of the most important phases in software development. It is the process of identifying, analyzing, and documenting the requirements needed to develop a successful software system. This phase helps developers understand the expectations of users and the functionality required for the project.

In this project, Requirement Analysis focuses on automating the standard laptop procurement process using ServiceNow Flow Designer. The system is designed to simplify the existing manual procurement workflow by automating request submission, approval, catalog task creation, notifications, and request tracking. A clear understanding of the requirements helps in building an efficient, reliable, and user-friendly procurement system.

2. PURPOSE OF REQUIREMENT ANALYSIS

The purpose of Requirement Analysis is to identify all the business and technical requirements before the development process begins. It helps ensure that the project satisfies organizational needs and improves the procurement workflow.

The main purposes are:

- Understand the current procurement process.
- Identify problems in the manual workflow.
- Define the features required in the automated system.
- Identify hardware and software requirements.
- Understand the needs of employees, managers, and the IT procurement team.

3. EXISTING SYSTEM ANALYSIS

The existing laptop procurement process is mostly manual. Employees submit requests through emails or forms, managers approve them manually, and the IT procurement team creates tasks separately.

Limitations of the Existing System:

- Delay in approving laptop requests.
- Manual entry of employee and laptop details.
- Difficulty tracking request status.
- Duplicate or incorrect purchase requests.

- Poor communication between employees, managers, and the procurement team.

These issues reduce productivity and increase procurement time.

4. PROPOSED SYSTEM ANALYSIS

The proposed system automates the entire procurement workflow using ServiceNow Flow Designer. Employees submit requests through the Service Catalog, managers approve them online, and the system automatically creates catalog tasks and updates request status.

Advantages of the Proposed System:

- Faster approval process.
- Automatic workflow execution.
- Real-time request tracking.
- Reduced paperwork and manual effort.
- Improved transparency and efficiency.

5. FUNCTIONAL REQUIREMENTS

Functional requirements describe the operations performed by the system.

Employee Requirements

- Submit laptop requests through the Service Catalog.
- View request status.
- Receive notifications after approval.

Manager Requirements

- Review employee requests.
- Approve or reject requests.
- Receive approval notifications.

IT Procurement Team Requirements

- Receive catalog tasks automatically.
- Process approved laptop requests.
- Update request completion status.

Administrator Requirements

- Manage Service Catalog items.
- Configure Flow Designer workflows.
- Monitor procurement requests.

6. NON-FUNCTIONAL REQUIREMENTS

Non-functional requirements define the quality and performance of the system.

- **Security:** Only authorized users can access procurement workflows.
- **Reliability:** Workflow should execute without errors.
- **Performance:** Requests should be processed quickly.
- **Usability:** User-friendly interface for employees and managers.
- **Availability:** System should be accessible whenever required.

7. HARDWARE REQUIREMENTS

The project requires the following hardware:

- Laptop or Desktop Computer.
- Minimum 4 GB RAM.
- Internet Connection.
- Keyboard and Mouse.

These hardware components are sufficient to access and operate the ServiceNow platform.

8. SOFTWARE REQUIREMENTS

The project uses the following software:

- ServiceNow Platform.
- Flow Designer.
- Service Catalog.
- Web Browser (Google Chrome or Microsoft Edge).
- Windows Operating System.

These software tools help in designing, executing, and monitoring the procurement workflow.

9. USER REQUIREMENTS

The system supports four main users:

- **Employee:** Employees submit laptop requests, track request status, and receive notifications after approval.
- **Manager:** Managers verify employee requests and approve or reject them through the ServiceNow approval workflow.
- **IT Procurement Team:** The IT Procurement Team receives catalog tasks automatically after approval and processes laptop allocation.

- **System Administrator:** The administrator manages Service Catalog items, configures Flow Designer workflows, and monitors procurement activities.

10. EXPECTED OUTCOMES

The automated procurement system is expected to:

- Reduce the processing time for laptop requests.
- Minimize manual errors in procurement.
- Improve communication between employees, managers, and the IT team.
- Provide real-time request tracking.
- Maintain accurate procurement records and workflow history.

11. CONCLUSION

Requirement Analysis provides the foundation for developing the automated IT procurement system. By identifying functional requirements, non-functional requirements, hardware, software, and user requirements, this phase ensures that the ServiceNow Flow Designer workflow meets organizational needs. The proposed automated system improves efficiency, transparency, and accuracy in the standard laptop procurement process.
